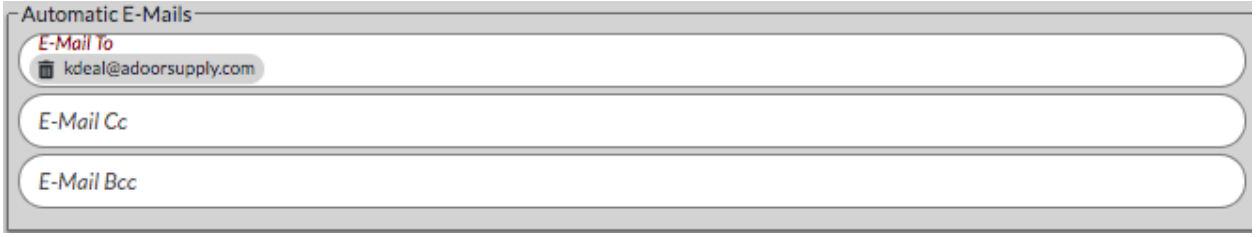
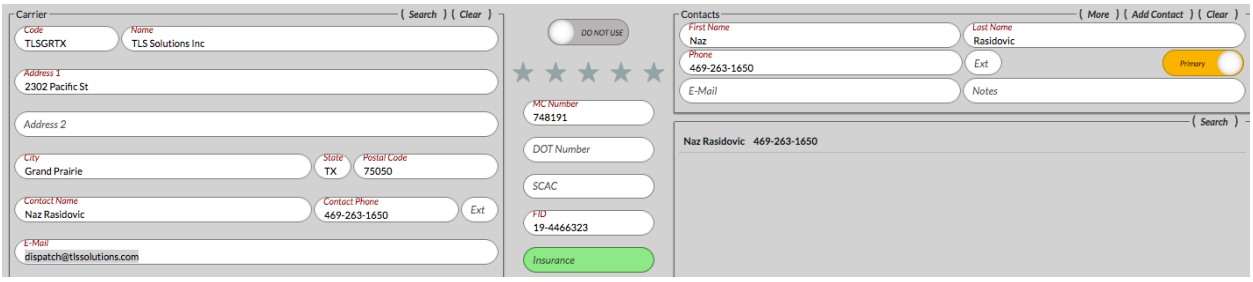
Carrier Changes Part 2

Here are a few changes to the Carrier screen.

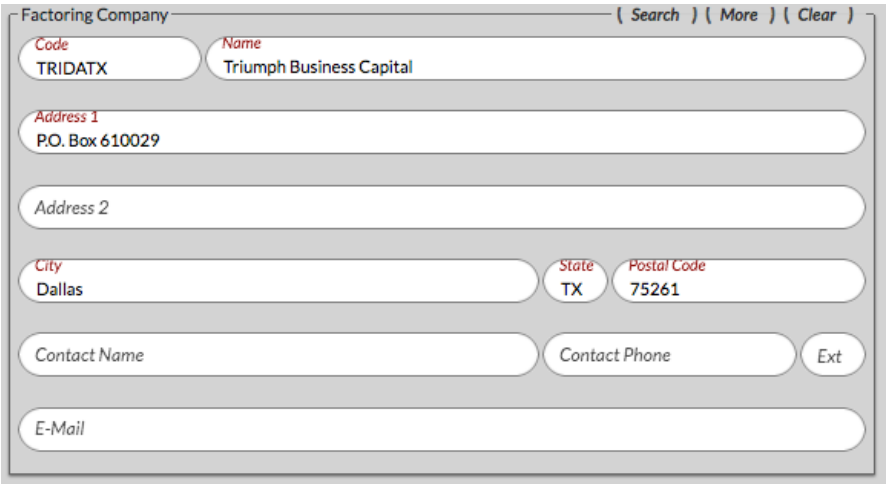
1. First off, everything is looking good. Great job and all that you are doing. I've been doing some testing an d showing the system to a lot of people and one thing that I have heard from more than a few is to get rid of the red field names and just increase the size of the font. Some have had issues in seeing the actual wording. This is especially true when you are inputting name into the Auto-email section. I'm not sure how difficult this will be. This will be something that will need to be done throughout the entire system. Not just in one area.



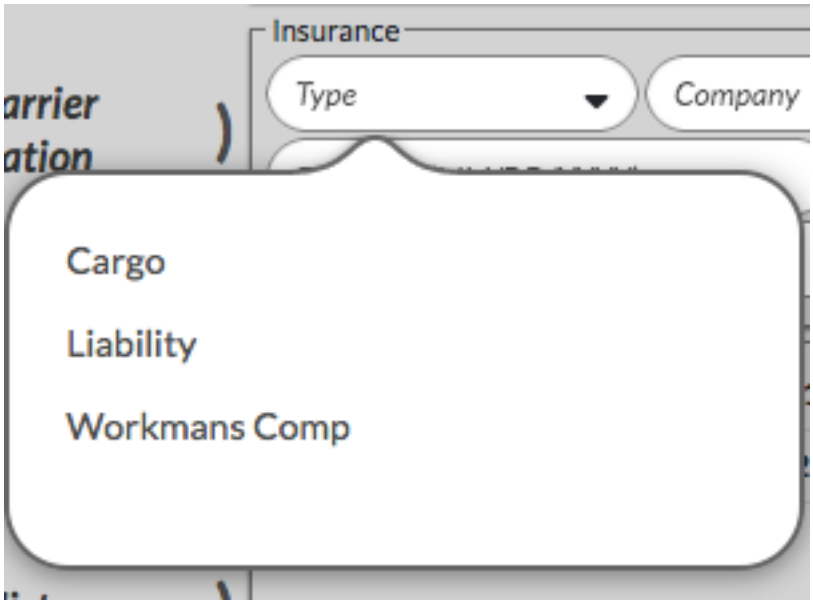
2. When I put in a carrier, everything works well. But when I put in the Contact Name, it carries it over correctly to the Contacts section. the only thing that isn't carried over is the e-mail address. Just need to have that be carried over as well.



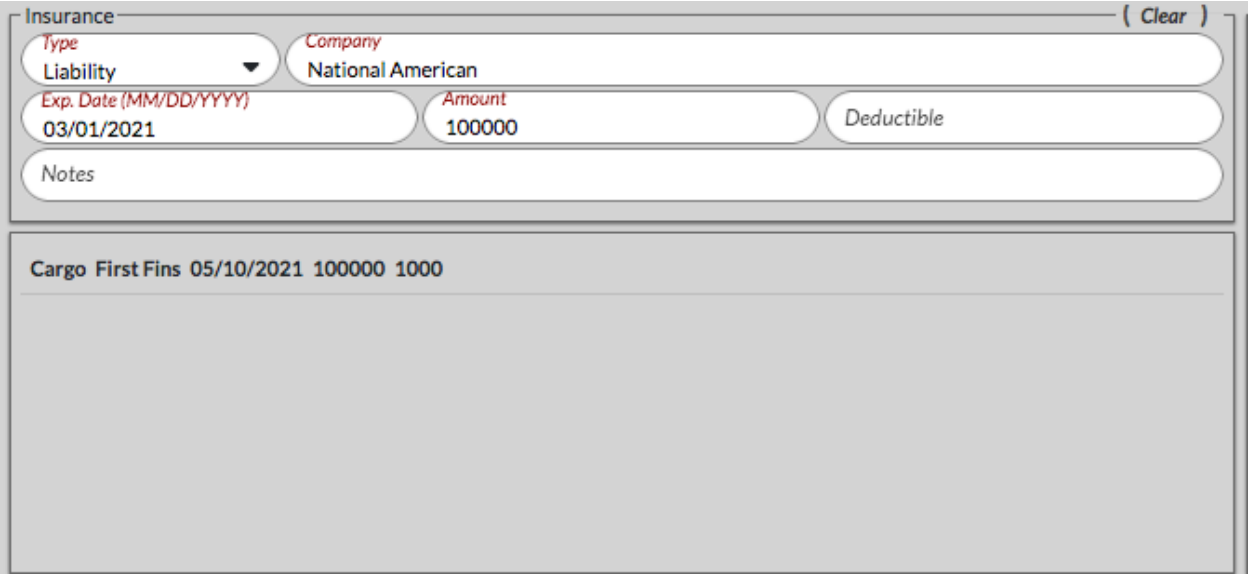
3. When I put in the Factoring Company, it did everything correctly. Except the "Search" button doesn't do anything. It needs to bring over a panel with a list of all the factoring companies I've entered into the system. Then the user can double click the company name and it will come back to this section and automatically fill everything in. Also, it needs to be a double click that does that. We are going to use the single click to bring over another panel that will have all that companies information. I'll send you a mock up of that later.



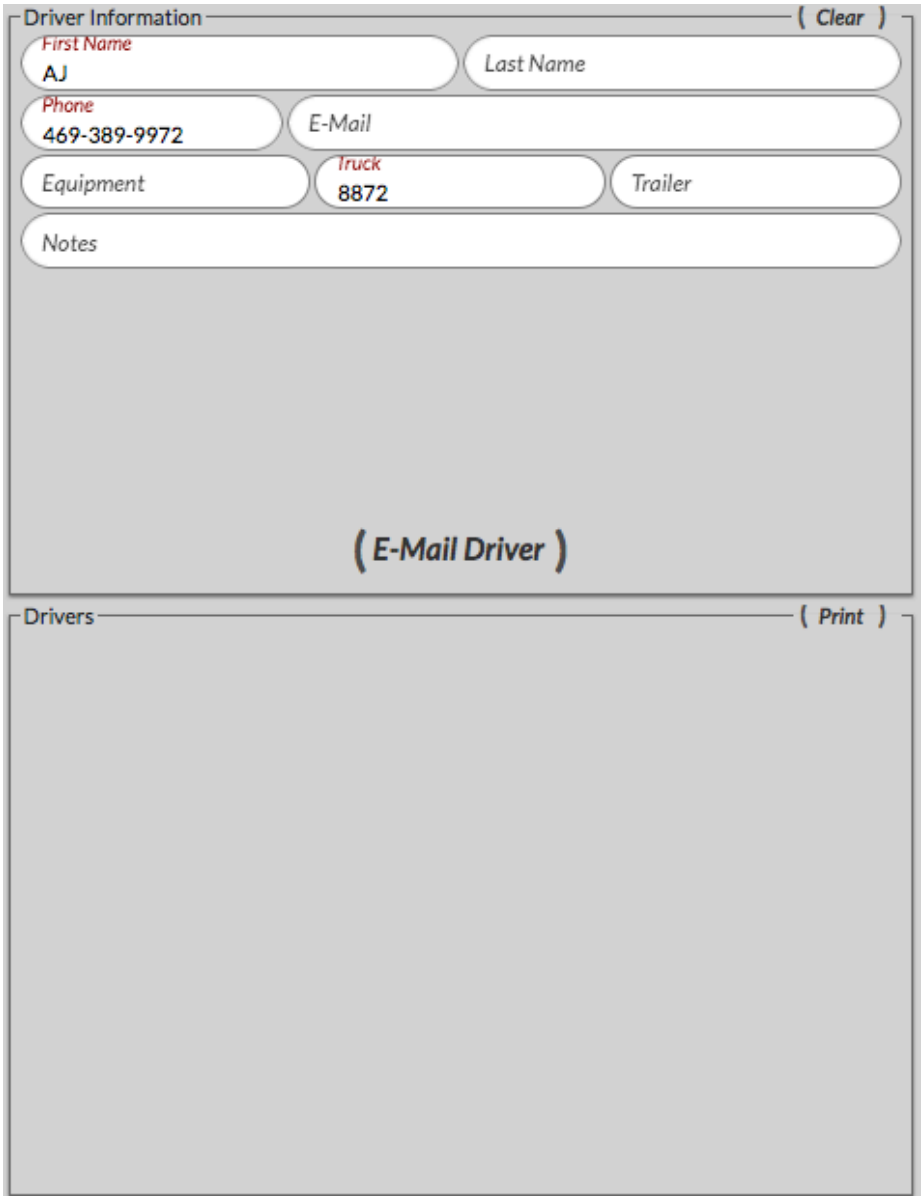
4. When I'm putting in the insurance information I have to click in the Type field and then choose which insurance I want. Which is fine, except I can't utilize the arrow keys to go through the different types. I have to use the mouse. The user needs to have the ability to use the arrow keys when they want to.



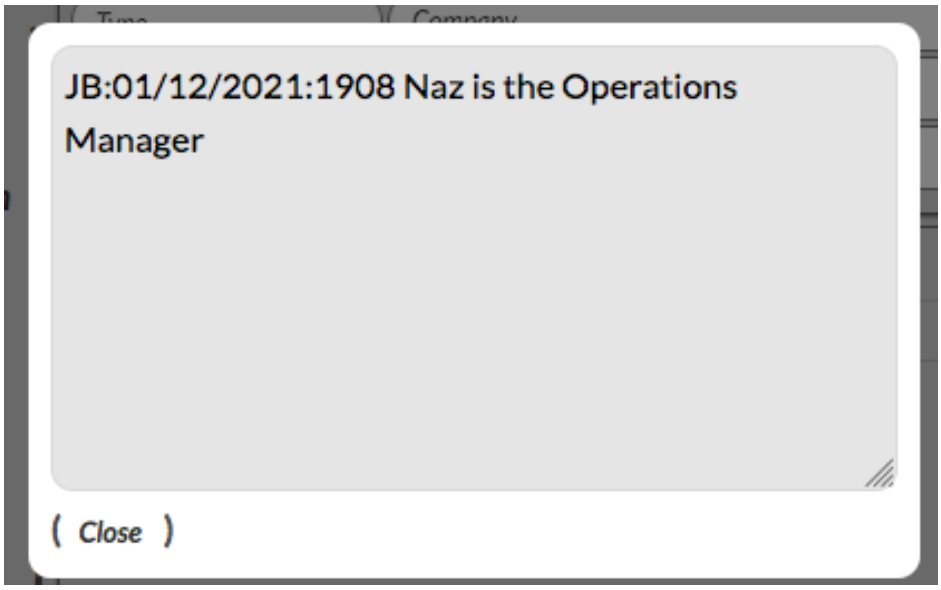
5. After I go through and enter in the information, it isn't transferred to a line item until after I put in a deductible. It needs to be added to the line items after I put something in the "Amount" field. The "Deductible" and Notes" fields aren't required.

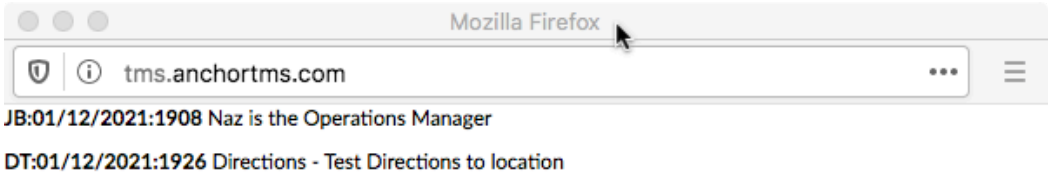


6. Also, after I tab through the “Notes” field, the curser needs to go back up to the “Type” field. And all the fields need to be cleared so that I can input another insurance type if I need to.
7. When I’m in the “Type” field, there also needs to be type ahead function. I should just be able to type a “C” or “L” or “W” and the system with fill the rest in. That way all I have to do is hit the TAB key and go on to the next field. The same thing needs to happen in the “Company” field. There are a lot of Insurance companies, but I also see a lot of trucking companies utilizing the same insurance companies. So the Type Ahead feature needs to be implemented. I’ll type until I see the right name, and then hit the TAB key and go on to the next field.
8. In the Driver section, the only thing that should be required is the “First Name” field. Once that is tabbed through, then you should get a line item below. this way I might put in a name and a little bit of information quickly, and then come back later to clean it up or add more information.

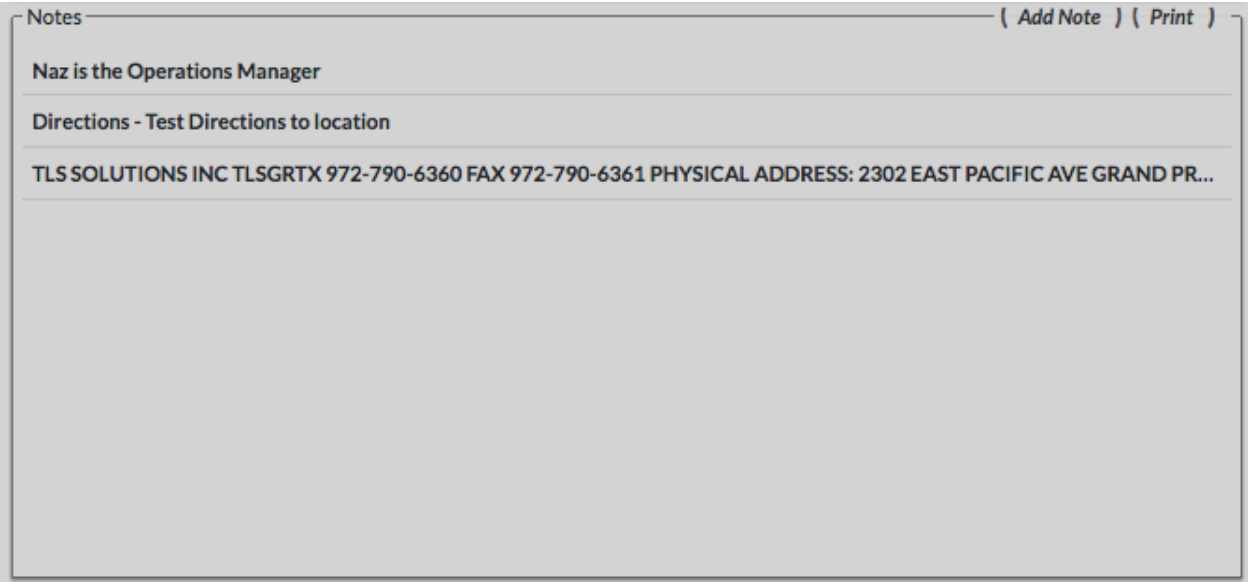


9. Also, the drivers in the list area need to be shown in alphabetical order by first name.
10. I'lll be sending a spreadsheet of all the equipment types. This list will also follow the type ahead principle.
11. For the Notes section. We need to add a print button to the bottom of the notes pop up. Currently when you hit the "Print" button, you print out all the notes. Which is perfect. Since you are doing it from the overview area. But If I only want to print out a single note, then that is different. So when I click on the note, then I hit the print button and it only prints out that one singular note.





12. Also need to look into adding a subject line. As you can see the notes line gets mighty unorganized when you enter in a lot of text in the notes box.



13. When I go to view the super long notes, I'm unable to even move the scroller up and down to read the note.

14.
